Learn Basics Task 2 Documentation

Language used - Python 3.10

Library used – pandas

Functions-

1) uniqcolumns-
   This Function is used to split the column names into 2 parts, namely- test_name(name of the test) and column_name(name of the parameter)

2) conversion_func-
   This function takes the data and converts it to the required format. It returns the dataframe in the required format as the output.
